Time Series

1. Please make sure to submit your assignment in English next time.

2. Which dataset will you use? This should be clear from the beginning.

3. You mention some models to predict the behavior of time series. All of these should be mathematically supported in your next assignment. Therefore, you should include a part that formally introduces the models you are going to use.

4. I think you should discard neural networks, as this would require other parallelization techniques that may complicate your project unnecessarily. Also, you should discuss how do you aim to implement a parallelization architecture to test those models. That is, you need to answer:

   - Which parallelization architecture will I use?

   - How I will split the data/models to parallelize?

5. Your references should be cited in the main document wherever are required. I think that this will appear naturally when you include the theory on your proposal.
